

Can Ownly turn a cheaper first order into a repeat habit in Gachibowli?

How large and durable must Ownly's price advantage be to break Swiggy/Zomato lock-in in Gachibowli, and what restaurant coverage, discovery and delivery experience are required so that price-led trial becomes repeat usage?

SURVEY N=46 HYDERABAD · 20-35	PRICE AUDIT · 12 RESTAURANTS · 1 SLOT	APP REVIEWS N=37 · SOCIAL N=524	INTERVIEWS 1 DOCUMENTED (+ TEAM-REPORTED) · FAKE DOOR 0	COMPILED 2026-09- 18
-------------------------------------	---	---------------------------------------	---	----------------------------

01 BUSINESS PROBLEM

Ownly is already live in Gachibowli — and almost nobody here is using it.

Among 46 respondents aged 20–35, 37% had heard of Ownly, 4% had ever ordered, and **zero** of the 40 recent food orderers placed an Ownly order in the last four weeks. The question is not whether the price gap exists — we measured it — but why it is not converting.

THE BUSINESS TENSION

Cheaper final bill

observed: ₹114 median saving on list price

First trial

stated: 37% aware · 4% tried

?

the gap this study examines

Repeat / main app

stated: 35% would continue once the offer ends

Restaurant availability

67% will not give up their usual restaurants for ₹30

Delivery & fulfilment

Ownly quoted +17 min vs the incumbent median

Memberships & coupons

50% of Ownly's price wins reverse after incumbent offers

Survey items are stated behaviour and stated preference. The audit is observed. Neither measures actual first-order conversion — the fake-door test was not run.

THREE STRONGEST CASES FROM THE CHALLENGER DOSSIERS
THE HISTORICAL WARNING

CHALLENGER	WHAT HAPPENED	EVIDENCE
Uber Eats India	Operating loss per order of \$2.55 against an average order value of \$2.45 — it lost more per order than the order was worth. Sold to Zomato, Jan 2020.	FACT — SEC Form 8-K, Ex. 99.1
Foodpanda India	Daily orders fell from ~200,000 to ~5,000 (–97.5%) once discounting stopped. FY19: revenue ₹82 Cr, loss ₹756 Cr.	MEDIA REPORT / RoC filings
ONDC network	Monthly orders fell 6.5M → 4.6M (–29%) after buyer-app incentives were cut ~90%.	MEDIA REPORT — single upstream

Analogy, not proof. These are different companies in different years. Ownly must be judged on Ownly's evidence — see tab 10.

THE DECISION THIS STUDY SERVES

Which parts of the Bengaluru playbook should Gachibowli **KEEP, ADAPT** or **DEPRIORITISE**?

Answered on tab 13, with each call traced to a named observation.

Ownly controls price well and discovery badly — and the market controls the rest.

Inputs are grouped by whether Ownly can move them. The two it owns outright (fee load, quoted ETA) are strong and weak respectively; the two that decide the outcome (assortment overlap, membership lock-in) are largely set by the incumbents.

INPUT → BEHAVIOUR → OUTPUT

Arrows denote hypothesised influence, not measured causality. No causal test was run. Every figure carries its base and evidence type.

Ownly wins every basket on list price — and loses half of them at the checkout people actually see.

Price Win Rate is 100% on list price plus fees. 50% of those wins reverse once incumbent coupons apply, and 25% reverse on the membership benefit alone — before any coupon.

100% Price Win Rate (structural) n=4	₹114 Median Basket Saving (structural) n=4	50% Offer Reversal Rate n=4	25% Membership Erosion Rate (custom) n=4
67% Assortment Barrier Rate n=46	83% Incumbent Lock-in Rate n=46	85% Rapido Discovery Gap n=39	44pp Stated Trial-to-Repeat Intent Gap n=46
18pp Fee Load Advantage (custom) n=37			

CUSTOM KPIS

TWO METRICS WE DEFINED OURSELVES

Membership Erosion Rate (custom) — 25.0%

baskets Ownly wins on list+fees but loses once the incumbent MEMBERSHIP benefit alone applies / matched baskets (no coupon involved)

Why it is a good indicator. Isolates how much of Ownly's edge a subscription alone removes, before any coupon. Good indicator because a membership is a STANDING benefit (it applies to every order), whereas a coupon is episodic - so this is the durable half of the erosion.

Fee Load Advantage (custom) — 18.2pp

median incumbent non-food share of bill - median Ownly non-food share

Why it is a good indicator. Ownly's structural edge expressed as the share of the bill that is NOT food. Good indicator because it is the one advantage Ownly controls directly: it survives without subsidy, unlike a discount, and it is invisible to the customer unless stated - which links it to the communication problem.

Both are computed from the same audit rows as the standard metrics; the definitions are in data/metric_dictionary.csv.

STATED AS A LIMIT, NOT HIDDEN

BUSINESS METRICS THAT ARE NOT ESTIMABLE FROM THIS EVIDENCE

METRIC	WHY NOT ESTIMABLE
Customer Acquisition Cost (CAC)	No spend data, no attributable acquisition counts
Customer Lifetime Value (CLV)	No repeat-purchase or margin data for any platform
True retention / cohort curves	No longitudinal panel; survey is a single cross-section
Market share (value or volume)	No denominator for Hyderabad food-delivery orders
Contribution margin / EBITDA / burn per order (Ownly)	Never disclosed by Rapido; no filing exists
Actual delivery time vs quoted ETA	Test orders were not placed; only quoted ETA observed
First-order conversion rate (behavioural)	Fake-door experiment was not executed (0 events)
Restaurant-side economics in Hyderabad	No restaurant interviews conducted

No proxy, assumption or benchmark was substituted for any of these. Reporting them as unknown is a finding about the evidence base.

₹30 buys time. ₹30 buys reliability. ₹30 cannot buy away your usual restaurants.

The same ₹30, three trades, same 46 respondents. 85% will wait 15 minutes longer and 67% will accept worse reliability — but only 33% will give up their restaurants.

WHAT WILL GACHIBOWLI USERS TRADE FOR ₹30?

Hyderabad respondents aged 20–35, n=46. Forced binary choice, ₹260 vs ₹230 held constant across all three items. SURVEY — STATED PREFERENCE. McNemar (paired, assortment vs speed): $p=8e-06$.

READING THE RESULT

WHY THIS IS THE MOST DECISION-RELEVANT CHART IN THE STUDY

It isolates one variable

The rupee amount never changes. Only the thing being given up changes. So the differences are attributable to the attribute, not to price sensitivity.

It contradicts the project's own prior

The pre-registered prediction (PAP §6.7, P3) was that Ownly's ~17-minute ETA deficit would block adoption. **It was falsified** — 85% accept the slower option. Speed is not the constraint. Assortment is.

The saving people need is small. The saving Ownly delivers is large — until an incumbent coupon lands.

Median stated requirement is ₹50 of recurring saving. The observed structural saving is ₹114. That is a comfortable fit. After coupons the observed saving is –₹28, and the fit disappears entirely.

HOW MUCH RECURRING SAVING DO USERS REQUIRE?

Cumulative share of Hyderabad respondents whose stated threshold is met at or below each level. n=35 gave a rupee figure. Held separate and NOT in the curve: 5 said no amount would make them switch, 6 said don't know. SURVEY — STATED PREFERENCE.

WHAT SAVING DID WE ACTUALLY OBSERVE?

₹114

structural saving — clears the stated bar of **100%** of the 35 respondents who named a threshold

₹78

after the incumbent membership benefit alone — still clears most thresholds, but 25% of baskets have already flipped

— ₹28

after incumbent coupons Ownly is **dearer** — no positive threshold can be cleared

Matched restaurant x basket comparisons at one Gachibowli address, wed_dinner 2026-09-16. n=4 complete three-app comparisons. PRIMARY OBSERVED DATA.

NOT A CONVERSION FORECAST

PRICE-TO-SWITCH FIT — THE INTERPRETATION

On list price, Ownly's saving clears the stated switching bar of every respondent who named one. That is a genuine structural achievement, and it is why **price can acquire**.

But 83% of this sample holds an incumbent membership, so the list view is not the view most of them see. This is a **fit** statement about price levels, not a forecast of conversion or share — neither was measured.

Ownly is structurally cheaper and structurally slower — and the discount war undoes the first half.

Non-food charges are 5% of an Ownly bill against 28% on Swiggy and 18% on Zomato. Ownly's quoted ETA is +17 minutes against the incumbent median.

FINAL PAYABLE VS QUOTED ETA

Each mark is one platform × basket capture, list price plus fees, no coupon. ■ Ownly ■ Swiggy ■ Zomato. Dashed lines are medians. PRIMARY OBSERVED DATA.

SAME FOUR BASKETS, THREE VIEWS

HOW OWNLY'S PRICE ADVANTAGE ERODES, IN TWO STEPS

-13.9%

A membership alone — before any coupon — flips 25% of the baskets; coupons flip 50%. Since 83% of our sample holds a membership, the top row is not the view most of them see.

BILL COMPOSITION — PARADISE BIRYANI, OWNLY

Ownly charged no delivery, platform or packaging fee in every captured row. Only GST is added.

BILL COMPOSITION — PARADISE BIRYANI, SWIGGY

The fee stack is the structural difference between the two platforms.

Ownly sells the same restaurants as the incumbents — 91% overlap, and one exclusive.

Of the audited restaurants carried by at least one incumbent, 91% are also on Ownly. Exactly 1 restaurant was Ownly-only; 1 was missing from Ownly. This is the factual basis of the 'no new use case' risk.

RESTAURANT COVERAGE AT ONE GACHIBOWLI ADDRESS

RESTAURANT	OWNLY	SWIGGY	ZOMATO	STATUS
Aanimuthyalu unlimited	●	—	—	Ownly only
Bawarchi	●	●	●	On all three
Cream Stone	●	●	●	On all three

Shah Ghouse	●	●	●	On all three
Wendy's Burgers	●	●	●	On all three

DP1, 2026-09-16. ● = listed. 12 restaurants audited. PRIMARY OBSERVED DATA. Aanimuthyalu Unlimited appears once after correcting a duplicate spelling in the capture sheet.

WHAT THE SURVEY SAYS ASSORTMENT IS WORTH

OBSERVED SLOTS ONLY
DAYPART COVERAGE

	Lunch	Dinner	Post-midnight
Ownly	not captured	captured	not captured
Swiggy	not captured	captured	not captured
Zomato	not captured	captured	not captured

Only the wed_dinner slot was captured. Lunch and post-midnight were not audited, so **late-night availability is neither confirmed nor refuted here**. Social data flags a late-night reliability risk; demand importance remains unvalidated.

Rapido gives Ownly access to the customer, not discovery of the product.

67% of respondents used Rapido in the last four weeks, but only 15% of Rapido users had noticed that food can be ordered inside it. The distribution asset is real; the discovery it produces is not.

OWNLY FUNNEL IN THIS SAMPLE

Hyderabad respondents aged 20–35, n=46. **DIRECTIONAL — LOW BASE** at the trial stage (2 respondents). SURVEY — STATED BEHAVIOUR.

DISTRIBUTION VS DISCOVERY

'Not sure' is counted as not-noticed. Respondents who do not use Rapido are excluded from the discovery base. Rapido Discovery Gap = 85%.

A RECOMMENDATION THIS EVIDENCE CHANGED

THE INTERVIEWS POINT THE LEVER SOMEWHERE ELSE

What we measured

An 85% discovery gap inside Rapido. The obvious inference is “fix the in-app placement”.

But that inference was never tested — and the interviews suggest it is the wrong first move.

What the interviews say

Trial comes from **a friend's recommendation, influencers, Instagram and YouTube reviews**. The one documented interviewee heard about Ownly **from her brother** — not from the Rapido app.

Survey agrees: after price, the most-cited trial trigger was **“a friend telling me it works well”**.

So the higher-value experiment is a **referral or creator-led trial mechanism**, not a placement change.

Interview evidence: T-4, T-6, I-01.9 in `04_interviews/interview_findings_coded.md`. **NOT ESTABLISHED:** no CAC is calculated and none can be; whether either lever raises trial is untested — both are experiments, not inferences.

What people argue about is price. What people who actually ordered report is fulfilment.

Price doubt is 38% of public discussion but 0% of app-store reviews. Fulfilment failure runs the other way — 19% of discussion, 72% of reviews.

STATED TRIAL INTENT VS STATED POST-OFFER CONTINUATION

Trial-to-repeat intent gap = **44pp**. STATED-INTENT PROXY — this is not observed retention, and the two items use different framings.

CODED THEME MENTIONS BY EVIDENCE BASE

THEME FAMILY	APP-STORE REVIEWS	FIRST-HAND OWNLY ACCOUNTS (SOCIAL)	PUBLIC DISCUSSION (SOCIAL, RELEVANT)
PRICE_DOUBT	0.0	20.6	37.5
PRICE_ADVANTAGE	10.3	22.7	15.5
FULFILMENT_FAIL	72.4	49.5	18.9
SUPPORT_REFUND	79.3	37.1	16.3
ASSORTMENT	0.0	9.3	12.1
COMPETITION	0.0	2.1	11.0
TRUST_QUALITY	13.8	3.1	1.1
DISTRIBUTION	0.0	0.0	7.6

Share of coded items mentioning the theme family — NOT an order failure rate. App-store reviews n=37, first-hand social accounts n=97, public discussion n=420. All three bases are self-selected toward complaint. CONSUMER-GENERATED.

WHERE EACH FACTOR APPEARS TO BIND

PRE-ORDER

Price

100% of stated switching thresholds are cleared by the observed structural saving.

SWITCHING

Restaurant availability

67% will not trade their usual restaurants for ₹30 — the highest of the three trades.

POST-ORDER

Fulfilment & support

72% of coded app-store reviews and 50% of first-hand accounts mention fulfilment failure.

INTERVIEWS RESOLVE A CONTRADICTION THE SURVEY ALONE COULD NOT

RELIABILITY: ACCEPTED AT THE POINT OF CHOICE, FATAL AFTER REPETITION

The contradiction

The survey says **67% will accept worse reliability for ₹30**. The review record says fulfilment failure is **72%** of coded app-store reviews. Both cannot be the headline.

What the interviews resolve

Interviews report that people leave an app after **frequent bad orders**. Users *accept* a reliability risk when choosing; they *leave* after it actually happens, repeatedly. Different decision moments — so both findings hold. **Reliability is a churn driver, not a trial blocker.**

Interview evidence: `04_interviews/interview_findings_coded.md` (T-5). This is why reliability sits in the retention guardrail on tab 13, not in the acquisition hook.

YOUTUBE · 2 VIDEOS · 275 COMMENTS RETRIEVED VERBATIM

WHAT AN ENGAGED PUBLIC AUDIENCE ARGUES ABOUT

Every first-hand Ownly user in 275 comments — all three of them:

“I stopped using Zomato recently & Swiggy long back. I use only Ownly & I pay good enough tip to the captains, a third of the extra money that I would have paid for the food on Zomato or Swiggy. Also, these captains are too humble and deny the tips. We have to ask them to provide the QR Code.”

YOUTUBE COMMENT · 50 LIKES

“Ownly is not that cheap .. I use ownly ..they have no discount on any restaurant .. same menu available in Swiggy with lesser cost after discount”

YOUTUBE COMMENT · 1 LIKES

“I use their food delivery service "Ownly" and my experiance has been superb. Fast delivery, zero delivery charge, zero platform fee, i pay exactly what i pay at the hotel. The number of restaurant need to improve but there is steady growth”

YOUTUBE COMMENT · 0 LIKES

Shares are of the 105 comments carrying at least one coded theme — **not** order failure rates and **not** population incidence. RESPONDENT VOICE

“I am ready to pay for the rider and the app can charge it from the restaurants”

SURVEY OPEN TEXT, HYDERABAD

“Service P has more all the restaurants even the common ones not only tiffins and things like that as I usually only get to order food from outside on special days and very occasionally so I always order smtg fun to have but the packaging delivery and all other fees make it hard to buy even a normal burger”

SURVEY OPEN TEXT, HYDERABAD

“It has more variety of restaurants and i would need that more often than not”

SURVEY OPEN TEXT, HYDERABAD

“Price”

SURVEY OPEN TEXT, HYDERABAD

“Cheaper prices”

SURVEY OPEN TEXT, HYDERABAD

Verbatim open-text answers to “what made you pick that one?”, Hyderabad respondents (n=24 answered). Interview findings are coded separately in `04_interviews/interview_findings_coded.md` ; the transcript is Gemini auto-notes and is **not yet human-verified**, so no interview quote is placed on a slide here.

Ownly has escaped the mechanism that killed the others — and inherited two more.

Its price gap is structural rather than subsidy-funded, which is genuinely different in kind from Foodpanda. But it sells the same restaurants more slowly, and its revenue architecture is thinner than any incumbent's.

FIVE FAILURE MECHANISMS, SCORED AGAINST OUR OWN EVIDENCE

M1 RENTED DEMAND

PARTIALLY ESCAPED

HISTORICAL EVIDENCE

Foodpanda: 200,000 → 5,000 daily orders (−97.5%) when discounts stopped. ONDC −29% after incentive cuts.

OWNLY EVIDENCE (ours)

Ownly's gap is **structural** (fee removal), not discount-funded: non-food load 5% vs 28%/18%. But 89% of our sample expects the low prices to rise anyway.

M2 ATTACKING THE NON-SCARCE SIDE

AT RISK

HISTORICAL EVIDENCE

Zomato told the CCI ~1% of its restaurants are exclusive — 99% already multi-home. Thrive died at 3% commission.

OWNLY EVIDENCE (ours)

Ownly's zero-commission wins supply the incumbents already have: 91% overlap, 1 exclusive restaurant observed.

M3 NO NEW USE CASE

AT RISK

HISTORICAL EVIDENCE

Eternal Q1FY27: "the same restaurants, similar or longer delivery times... there's no new use case being unlocked here."

OWNLY EVIDENCE (ours)

Our own audit confirms both premises: 91% assortment overlap and +17 min quoted ETA. Survey shows speed is tolerated, so the binding half is assortment.

M4 RELIABILITY FLOOR

UNKNOWN

HISTORICAL EVIDENCE

Ola exited ONDC after tracking, refund and support failures. Eternal's cohorts held 46%→49% through the price war.

OWNLY EVIDENCE (ours)

72% of coded reviews mention fulfilment failure. But our survey finds 67% will accept worse reliability for ₹30 — stated tolerance is higher than the complaint record suggests.

M5 THIN REVENUE ARCHITECTURE

UNKNOWN

HISTORICAL EVIDENCE

Incumbents earn a take rate plus a ₹17.58 platform fee plus subscriptions plus ads. Platform fee rose >645% in 31 months.

OWNLY EVIDENCE (ours)

Ownly charged ₹0 delivery, ₹0 platform and ₹0 packaging in every captured row, and takes 0% commission. Burn per order is **UNKNOWN** — no figure is published anywhere. **New signal:** rider economics is the single largest theme in 275 retrieved YouTube comments (28% of coded comments, 1,167 likes) — repeatedly arguing riders earn more per hour from bike taxi than from food delivery.

Historical cases are analogies, not causal proof. **No statement here asserts that Ownly will fail.** Each status describes whether the historical risk signal is present in our Gachibowli observations. Sources: 01_secondary_research/challenger_failures/ (5 dossiers, ~230 sources).

No recommendation rests on a single source — and the interviews changed two of them.

Fourteen dimensions across seven evidence types. Interviews were conducted after the first build of this dashboard; they resolved the reliability contradiction and redirected the discovery recommendation. The interview count is still UNKNOWN, so no interview finding carries a prevalence figure.

● SUPPORTS
 ▲ CONTRADICTS
 ◐ MIXED
 · NO EVIDENCE

Contradictions are shown, not reconciled. Two are load-bearing: the survey **contradicts** the review record on reliability, and **contradicts** the assumption that Rapido creates discovery.

INTERPRETATION STRENGTH BY DIMENSION

DIMENSION	CURRENT INTERPRETATION
Price advantage exists	STRONG (structural view only)
Price advantage survives offers	MODERATE — erosion observed
Assortment is the binding constraint	STRONG (survey + audit; interviews silent)
Speed deficit blocks adoption	CONTRADICTED by survey AND interviews
Reliability blocks TRIAL	CONTRADICTED — accepted prospectively for ₹30
Bad orders drive CHURN	STRONG — interviews supply the mechanism
Support/refund is a risk	MODERATE (self-selected sources)
Rapido creates real discovery	STRONG — trial runs on word of mouth instead
Membership lock-in is material	STRONG — interviews explain the mechanism
Price durability is doubted	STRONG (near-universal in survey)
Hygiene / food-quality trust	DIRECTIONAL — survey is blind to this
Very low price signals low quality	DIRECTIONAL — a cost of the price-led claim
Late-night availability gap	DIRECTIONAL — supply gap only, demand unvalidated
Rider supply is sustainable	DIRECTIONAL — the single largest public-comment theme
Sustainable unit economics	UNKNOWN for Ownly — not disclosed anywhere

Price is the hook Ownly has. Assortment is the hook the evidence asks for.

Five territories, each scored on our own evidence. Only one couples the advantage Ownly owns to the constraint respondents actually named.

PROPOSITION TERRITORIES

PRICE

ADAPT

“Same food. Smaller final bill.”

Customer job: Pay less for the order I was going to place anyway.

EVIDENCE FOR

Price Win Rate 100% on list+fees; median saving ₹114; fee load 5% vs 28%; 100% of stated thresholds cleared.

EVIDENCE AGAINST

50% offer reversal; 83% hold memberships; 89% expect the prices to rise; forced choice P vs Q not significant ($p=0.73$).

BUSINESS LOGIC

Cheapest to communicate, and already true. But it is the claim every failed challenger made.

RISK

Incumbent coupons neutralise it within one campaign cycle.

CONFIDENCE: MODERATE

PRICE + ASSORTMENT

KEEP & BUILD

“The restaurants you already order from — at a smaller final bill.”

Customer job: Get my usual food for less, without giving up where I order from.

EVIDENCE FOR

67% will not trade usual restaurants for ₹30 (highest of three trades, McNemar $p=8e-06$); assortment is the only attribute price could not buy; open text repeatedly names restaurant availability.

EVIDENCE AGAINST

Ownly already carries 91% of incumbent-listed restaurants, so the claim is close to parity today; only 1 exclusive observed; Pizza Hut missing.

BUSINESS LOGIC

Couples the one advantage Ownly owns (price) to the one constraint users named (assortment). Defensible because assortment depth is slow to copy.

RISK

Requires named local supply depth, which we have not measured beyond 12 restaurants.

RELIABILITY

TEST LATER

“A cheaper order that still turns up.”

Customer job: Save money without gambling on whether dinner arrives.

EVIDENCE FOR

72% of coded reviews mention fulfilment failure; incumbents recovered failed orders better in 3 of 3 direct comparisons.

EVIDENCE AGAINST

Our survey contradicts the urgency: 67% will accept worse reliability for ₹30. No Ownly reliability data exists for Hyderabad.

BUSINESS LOGIC

A guardrail, not a hook. Necessary to retain; insufficient to acquire.

RISK

Promising reliability without measuring it invites the exact complaints in the review record.

CONFIDENCE: DIRECTIONAL

RAPIDO CROSS-SELL

TEST NEXT

“Food inside the app you already use.”

Customer job: Order food without installing or learning anything new.

EVIDENCE FOR

67% used Rapido recently — the access is real and free.

EVIDENCE AGAINST

85% of Rapido users had not noticed food in the app. Distribution ≠ discovery. Uber Eats ran exactly this play and sold for \$206M.

BUSINESS LOGIC

The cheapest available lever: the users are already in the app.

RISK

If placement is fixed and trial still does not move, the problem was never discovery.

CONFIDENCE: DIRECTIONAL

LOCAL SUPPLY

TEST NEXT

“Local favourites, without the online mark-up.”

Customer job: Order from the neighbourhood places that are missing or overpriced online.

EVIDENCE FOR

Local coverage 100% vs chain 80% in the audit; 1 Ownly-only local restaurant observed; zero-commission is structurally attractive to sub-₹150 eateries.

EVIDENCE AGAINST

Evidence base is 12 restaurants at one address. Demand for local-only supply is **not measured**.

BUSINESS LOGIC

The only territory an incumbent cannot match by cutting a fee, because it requires supply the incumbent does not have.

RISK

Unvalidated demand. Could be a supply story with no customer behind it.

CONFIDENCE: **DIRECTIONAL**

Confidence reflects evidence strength, not enthusiasm. No territory is recommended on the basis of what sounds compelling.

Keep the fee architecture. Adapt the price claim. Stop paying for speed.

Owlnly's advantage is real but it is being communicated as a comparison that incumbent coupons can falsify at will — against a sample where 83% hold a membership. The constraint respondents actually named was assortment, and speed was not a constraint at all.

KEEP / ADAPT / DEPRIORITISE

KEEP

Zero platform, packaging and surge fees

Observed: non-food load 5% vs 28% (Swiggy). This is the structural advantage and it survives without subsidy.

KEEP

Transparent, coupon-free everyday pricing

100% of stated switching thresholds are cleared by the observed ₹114 saving.

ADAPT

"Cheaper than Swiggy/Zomato" as the headline claim

50% of price wins reverse after coupons and 25% on the membership benefit alone. Against the 83% who hold memberships, the claim is often false at their checkout. Reframe around the everyday bill, not a comparison.

ADAPT

Restaurant breadth as the supply goal

91% overlap means breadth reproduces the incumbent catalogue. Shift the target to named local depth — the one thing ₹30 could not buy.

ADAPT

Rapido as a distribution channel

85% of Rapido users had not noticed food in the app. Access exists; discovery must be built and measured, not assumed.

DEPRIORITISE

Speed / ETA parity investment

85% accept 15 minutes slower for ₹30, so the pre-registered prediction that ETA blocks adoption was falsified. Spend the money elsewhere.

DEPRIORITISE

First-order discount depth

35% say they would continue once a ₹100 offer ends, and 89% expect prices to rise. Deeper intro discounts buy the trial the historical record says does not stick.

Each call is traced to a named observation in this deck. No call rests on the historical challenger record alone.

EXECUTIVE CONCLUSION

THE GTM ANSWER

WHO	Students and young professionals in the Gachibowli catchment who order 2+ times a month and do not hold an incumbent membership. In our sample that is a minority — 17% — and it is the only group who sees Ownly's list-price advantage at their checkout.
ACQUISITION HOOK	A smaller everyday bill on restaurants they already order from — not a cheaper-than-X comparison that a coupon can falsify.
PRICE REQUIREMENT	Median stated requirement ₹50 recurring. Observed structural saving ₹114. The level is sufficient; its durability is the open question.
SUPPLY REQUIREMENT	Depth in the specific restaurants respondents already use. 67% will not trade them for ₹30 — the strongest single constraint measured in this study.
CHANNEL	Rapido is access, not discovery: 85% gap. Treat in-app placement as an experiment with a measured trial outcome.
EXPERIENCE GUARDRAIL	Quoted ETA +17 min is tolerated. Fulfilment and refund failure — the dominant theme in first-hand accounts — is not measured in Hyderabad and is the guardrail to instrument first.
RETENTION	Unknown. Stated continuation after the offer ends is 34.8% and the trial-to-repeat intent gap is 43.5pp, but no behavioural retention was observed.
COMPETITIVE RESPONSE	Already visible. 50% of Ownly's price wins reversed on coupons in a single audit slot, and the incumbents hold roughly ₹15/order of platform-fee headroom to compress the gap further.
VIABILITY	Unresolved. Ownly charged ₹0 to the customer and takes 0% commission in every captured row. Revenue per order in Gachibowli was ₹0 observed . Burn per order is UNKNOWN and is not estimated here.

WHAT TO TEST NEXT

1. **Run the fake-door test that was never run.** It is the only instrument that yields a behavioural first-order conversion rate, which is what H_0 is actually about.
2. **Audit named local restaurants, not showcase chains.** Every Ownly price we hold is a chain; the strategy the evidence points to depends on depth we have not measured.
3. **Place 3 test orders.** Quoted ETA is not delivery time. The reliability guardrail is currently unmeasured in Hyderabad.
4. **Conduct the 8 interviews.** The mechanism behind every number in this deck is unvalidated.
5. **Re-audit against a membership-holding account.** 83% of the target holds one; the list-price view is not their reality.

Listed in order of decision value, not ease. Item 1 is the only one that would let a future version of this study answer H_0 as originally written.

We fail to reject H_0 on the stated-preference proxy — and the behavioural H_0 was never tested.

Service P Service P 18 vs Service Q 15 (plus 13 'can't choose'). Exact binomial $p = 0.7283$, [36.4%, 71.9%]. The two bundled propositions did not separate. The attribute-level trade-offs did.

STATUS

H_0 — BEHAVIOURAL (AS ORIGINALLY WRITTEN)

Among the Gachibowli target population, a Bengaluru-style Ownly proposition does not produce a significantly different FIRST-ORDER CONVERSION rate from a Hyderabad-localised proposition.

NOT DIRECTLY TESTED

The fake-door experiment was not executed: fact_fakedoor_events.csv contains 0 events. No behavioural first-order conversion was observed. This cannot be substituted with survey intent.

PROXY, NOT CONVERSION

H_0 — STATED-PREFERENCE ANALOGUE

Stated-preference analogue: the share choosing the Bengaluru-style proposition (Service P) does not differ from 50% among respondents who expressed a preference.

FAIL TO REJECT H_0

Test	Exact binomial vs 50% (two-sided), Wilson/Clopper-Pearson CI
Result	Service P 18 vs Service Q 15 (plus 13 'can't choose')
n	33 expressed a preference (of 46)
Statistic	P share = 54.5%
p-value	0.7283
95% CI	[36.4%, 71.9%]
Paired check	McNemar $b=6$, $c=5$, $p=1.0 \rightarrow$ FAIL TO REJECT H_0

13/46 (28%) could not choose between the two bundled propositions - itself a finding about proposition distinctiveness.

WHY THE NULL IS NOT THE END OF THE ANALYSIS

THE MORE INFORMATIVE DECOMPOSED FINDING

The two **bundled** propositions did not separate — but the **attributes inside them** separated sharply.

Holding ₹30 constant, 85% traded speed and 67% traded reliability, but only 33% traded their usual restaurants (McNemar $p=8e-06$). A bundled-concept test asks the wrong question of a 46-person sample; the attribute trades answer it with the same respondents.

REGISTERED 2026-09-18, BEFORE ANY RESPONSE WAS COLLECTED

PRE-REGISTERED PREDICTIONS P1–P5

P1

NOT SUPPORTED AS STATED (first limb fails)

Price framing wins trial but does not survive to repeat (M1 rented demand).

Service P did NOT significantly win trial ($p=0.728$); post-offer continuation 34.8% [22.7-49.2%]

The first limb requires Service P to win trial; it did not. The second limb (weak post-offer continuation) IS observed. So the retention concern stands on its own, but the 'price wins trial' premise is not supported in this sample.

P2

NOT TESTABLE

Coupon-dependent users see no Ownly advantage.

NOT TESTABLE

The live v3 form does not contain the offer-dependency item (planned Q13, 'of your last 10 orders how many used a coupon'). No substitute variable exists.

P3

FALSIFIED

The observed ETA gap exceeds stated tolerance (M3).

84.8% chose cheaper+slower [71.8-92.4%]

Pre-registered rule: P3 holds only if the lower CI bound is NOT above 50%. It is (71.8%). Respondents accept the slower option for INR 30. Since the survey tested a 15-minute gap and the audit observed ~17 minutes, this is close to but not identical with the observed gap - the inference is one-directional and is not claimed beyond 15 minutes.

P4

CONFIRMED

Assortment beats speed: users defend usual restaurants harder than delivery speed.

paid premium to keep restaurants 67.4% vs to keep speed 15.2%

The single strongest result in the survey. The same INR 30 buys a 15-minute delay for most respondents but cannot buy away their usual restaurants.

P5

NOT SUPPORTED

Durability doubt suppresses the price proposition.

rho = 0.212

Durability doubt is near-universal in this sample (89% agree), which leaves very little variance for an association to be detected. A null here is uninformative rather than evidence of no effect.

Registered in `09_analysis/M_pre_analysis_plan.md §6.7` as a separate SECONDARY Holm family. **P3 was falsified and P1's first limb failed** — both are reported as they came out. P2 could not be tested because the live form omits the offer-dependency item.

Evidence discipline. Every figure carries its base and evidence type. Survey items are stated behaviour or stated preference and are never described as conversion. Audit figures are observed at one Gachibowli address in one dinner slot (n=4 complete three-app comparisons) and are directional. Coded review and social counts are shares of coded items mentioning a theme — never order failure rates. Bengaluru and Hyderabad are never blended. CAC, CLV, EBITDA, market share, retention and burn per order are **NOT ESTIMABLE** from this evidence and no value is imputed for them. No respondent data was simulated or fabricated at any point.
